c=====
c  fdemo2:  Program which demonstrates basic usage
c  of character variables in Fortran 77.
c=====
      program          fdemo2

      implicit        none

c-----
c  See below for definition of integer function
c  'indlnb'.  Note that this and other useful routines
c  are available in the 'p329f' library.
c-----
      integer         indlnb

c-----
c  Define some character variables of various lengths
c
c  Note that
c
c      character*1    foo
c
c  and
c
c      character      foo
c
c  are synonymous, i.e. if an explicit length
c  specification is not given, the variable will
c  be a single character long.
c-----
      character*1     c1
      character*2     c2
      character*4     c4
      character*26    lcalph
      character       cc1*1,   cc2*2,   cc4*4
      character*60    buffer

c-----
c  Assignment of constant strings to char. variables.
c  If length of character expression being assigned
c  is less than length of character variable, variable
c  is 'right-padded' with blanks.
c-----
      c1 = 'a'
      c2 = 'bc'
      c4 = 'defg'
      lcalph = 'abcdefghijklmnopqrstuvwxy'

      write(*,*) 'c1 = ', c1
      write(*,*) 'c2 = ', c2
      write(*,*) 'c4 = ', c4
      write(*,*) 'lcalph = ', lcalph
      call prompt('Through constant assignment')

c-----
c  // is the string concatenation operator
c-----
      write(*,*) 'c1 // c2 // c4 = ', c1 // c2 // c4
      call prompt('Through concatenation')

c-----
c  The integer intrinsic (built-in) function 'len'
c  returns the length of its string argument
c-----
      write(*,*) 'len(c1) = ', len(c1)
      write(*,*) 'len(buffer) = ', len(buffer)
      call prompt('Through string length')

c-----
c  Substring extraction
c-----
      write(*,*) 'lcalph(1:13) = ', lcalph(1:13)
      write(*,*) 'lcalph(18:18) = ', lcalph(18:18)
      call prompt('Through substring extraction')

c-----
c  Substring assignment
c-----
      c4(4:4) = 'Z'

```

```

write(*,*) 'c4 = ', c4
call prompt('Through substring assignment')

c-----
c  Use of 'indlnb'
c-----
      buffer = 'somefilename'
      write(*,*) '<' // buffer // '>'
      write(*,*) '<' // buffer(1:indlnb(buffer)) // '>'
      buffer = 'Some multi-word message'
      write(*,*) '<' // buffer // '>'
      write(*,*) '<' // buffer(1:indlnb(buffer)) // '>'
      buffer = ' '
      write(*,*) 'indlnb(buffer) = ', indlnb(buffer)
      call prompt('Through indlnb usage')

      call prompt('Through fdemo2')

      stop
      end

c-----
c  Prints a message on stdout and then waits for input
c  from stdin.
c-----
      subroutine prompt(pstring)

      implicit        none

      character*(*)  pstring
      integer         rc
      character*1     resp

      write(*,*) pstring
      write(*,*) 'Enter any non-blank character & '//
& 'enter to continue'
      read(*,*,iostat=rc,end=900) resp
      return

900   continue
      stop
      end

c-----
c  Returns index of last non-blank character in 's',
c  or 0 if the string is completely blank.
c-----
      integer function indlnb(s)

      character*(*)  s
      integer         i

      do indlnb = len(s) , 1 , -1
         if (s(indlnb:indlnb) .ne. ' ') return
      end do
      indlnb = 0

      return

      end

```

=====
c Returns a double precision vector (one-dimensional
c array) read from file 'fname'. If 'fname' is the
c string '-', the vector is read from standard input.
c
c The file should contain one number per line; invalid
c input is ignored.
c
c This routine illustrates a general technique for
c reading data from a FORMATTED (ASCII) file. In
c Fortran, one associates a "logical unit number"
c (an integer) with a file via the OPEN statement.
c The unit number can then be used as the first
c "argument" of the READ and WRITE statements to
c perform input and output on the file.
c
c Fortran reserves the following unit numbers:
c
c 5 terminal input (stdin)
c 6 terminal output (stdout)
c 0 error output on Unix systems (stderr)
=====
      subroutine dvfrom(fname,v,n,maxn)
c-----
c Arguments:
c
c   fname: (I) File name
c   v:     (O) Return vector
c   n:     (O) Length of v (# read)
c   maxn:  (I) Maximum number to read
c-----
      implicit none
c-----
c The integer functions 'indlnb' and 'getu' are
c defined in the 'p329f' library.
c-----
      integer indlnb, getu
c-----
c Declaration of routine arguments: note
c "adjustable dimensioning" of v; any array which
c is declared with adjustable dimensions must be
c a subroutine argument; any adjustable dimensions
c must also be subroutine arguments.
c-----
      character*(*) fname
      integer n, maxn

```

```

      real*8 v(maxn)
c-----
c Programming style: Use parameter (ustdin) rather
c than constant value (5) for stdin logical unit #
c-----
      integer ustdin
      parameter (ustdin = 5)
c-----
c Local variables:
c
c   vn: Current number read from input
c   ufrom: Logical unit number for READ
c   rc: For storing return status from READ
c-----
      real*8 vn
      integer ufrom, rc
c-----

#####
# Do the default make (all: $(EXECUTABLES))
#
# Note the warnings from the loader, since routines 'dvto'
# and 'dvfrom' live in the p329f utility library. In this
# case we can safely ignore the warning, since the routines
# are identical.
#
# Also note that, for linking purposes, ALL Fortran routine
# names (more precisely, all external names) have an
# underscore appended---i.e. when you are linking object
# code generated from Fortran, and the linker complains that
# it can't find 'foo_', it's actually looking for a Fortran
# routine name 'foo'. C routine names, on the other hand,
# retain their identity in the "external world".

#####
# Here's an alias which lists all the executables in a
# directory using the fact that the -F flag to ls appends
# a '*' to the name of such files. I've included it here
# just to keep you thinking about tailoring your Unix
# environment to suit your own needs.
```

```
#####
newton 23> alias lsx
/bin/ls -F | fgrep \* | sed s/\*//g
```

```
newton 24> lsx
fdemo2
mysum
tdvfrom
tdvto
```

```
#####
# Clean up ...
```

```
#####
newton 25> make clean
make -f Makefile clean
rm *.o
rm fdemo2 mysum tdvfrom tdvto
```

```
newton 26> lsx
```
