

```

=====
c      newtsqrt:  Uses Newton's method to find (positive)
c      square root of number supplied on command line, i.e.
c      solves
c
c       $f(x) = x^2 - a = 0$ 
c
c      for given 'a'.  Optional second argument specifies
c      convergence criteria (relative dx).
c
c      Tracing output (written to standard error)
c      includes iteration number, estimated root (xn),
c      change in estimate (dxn), log10(dxn), residual and
c      log10(residual).
=====
      program          newtsqrt

      implicit        none

      integer          iargc
      real*8           r8arg,          drelabs

      real*8           r8_never
      parameter        ( r8_never = -1.0d-60 )

c-----
c      Default convergence tolerance.
c-----
      real*8           default_xtol
      parameter        ( default_xtol = 1.0d-8 )

c-----
c      Maximum allowed number of Newton iterations.
c-----
      integer          mxiter
      parameter        ( mxiter = 50 )

```

```

c-----
c   Command-line arguments (see above).
c-----
c   real*8           a,           xtol
c-----
c   Locals used in Newton iteration.
c-----
c   integer          iter
c   real*8           xn,          resn,          dxn
c-----
c   Argument parsing.
c-----
c   if( iargc() .lt. 1 ) go to 900
c   a       = r8arg(1,r8_never)
c   if( a .eq. r8_never .or. a .lt. 0.0d0 ) go to 900
c   xtol   = r8arg(2,1.0d-8)
c   if( xtol .le. 0.0d0 ) xtol = 1.0d-8
c-----
c   Un-inspired initial guess:  $x^{(0)} = a / 2$ .
c-----
c   xn = 0.5d0 * a

```

```

c-----
c   Newton loop.
c-----
      write(0,*) 'Iter          xn          '//
&      'dxn      log10(dxn)      rn      log10(rn)'
